## Data set Documentation

Quantitative survey data was collected in Estonia by the University of Tartu (UT) team.

### *Participants*

A total of 1087 respondents participated in survey. 574 of them filled adolescents' questionnaire and 513 young adults' questionnaire.

Respondents at regional/local level were approached from four Estonian regions, including the North (Tallinn), North-East (Ida-Virumaa), South-East (Tartu) and South (Valgamaa), in order to capture a range of different opinions across Estonia. To capture ethnic minorities, Russian version of questionnaire was created. 76% of respondents were Estonians and 34% preferred to fill Russian version. 63% of participants were females and 37% men.

The mean age of adolescents was 16,7 years (SD = 0,81; range 15-22) and the mean age of young adults was 21,3 years (SD = 3,55; range 16-44).

### **Methodology**

#### *Data collection procedure*

All participants filled online questionnaire. To enhance involvement of ethnic minorities, Russian questionnaire version was created. Members of ethnic minority had possibility to choose between Estonian and Russian versions.
